Every IT deployment involves risk and every system and the data housed within it can be vulnerable without effective risk management and mitigation. The move to cloud, particularly as it relates to governmental entities, puts a spotlight on these critical issues.

Historically, most of the focus on the risks associated with cloud computing has addressed traditional IT security issues, and not on governance, risk and compliance. But, GRC is fast emerging as a key issue to be addressed by governments. It is a critical and challenging issue for research and innovation, requires new or adapted modeling approaches for compliance, and is critical for detection of breaches and policy violations. This webcast, led by panelists Mike Binko, President and CEO of kloudtrack, and Greg Wallig, Principal, Grant Thornton LLP, teaches you how you can effectively manage risk in your cloud deployment .
